

Recovery Process if you accidentally mis-typed/mis-entered something during your LXD configuration steps during the ciab-desktop script executions.

ciab-desktop uses SNAP LXD not the APT version of LXD.

To Delete SNAP LXD the right way - per Stephane Graber, the lead LXD developer.

To completely remove SNAP LXD so you can re-attempt the installation you will need to follow these specific steps using the CLI:

1. **lxc list**
2. **lxc delete <whatever came from list>**
3. **lxc image list**
4. **lxc image delete <whatever came from list>**
5. **lxc network list**
6. **lxc network delete <whatever came from list>**
7. **echo '{"config": {}}' | lxc profile edit default**
8. **lxc storage volume list default**
9. **lxc storage volume delete default <whatever came from list>**
10. **lxc storage delete default**
11. **sudo delgroup lxd <to remove the /etc/group/lxd**

Effectively listing and the deleting all the objects until everything's clean.

After doing steps 1-11 you should execute:

\$ sudo snap remove lxd

just to be sure LXD has been removed from your system. Then you can attempt reinstallation of ciab-desktop from the beginning by re-execution of **./setup-ciab.sh**
